

## Interception Depth

Posted by Carlene - 2008/11/19 18:54

---

I'm creating a new land cover look up table for a particular study area and I would like to know how to calculate/determine the interception depth.

The interception field in the look-up table has units of mm and is only used with the KINEROS model. If you're using SWAT, don't worry about it because the SCS curve number method used in SWAT calculates initial abstractions on a daily basis and interception is lumped in that term.

For specific information on interception and how it is used in KINEROS, please refer to the KINEROS website under Documentation>Rainfall Interpolation & Interception.
